

- I want a startup calibration screen to show up on the first start up. It asks the user if they have any hearing test results from a medical exam.

    - If they do, it allows the user to import their own hearing test results through a pdf file or images through an upload or import button
    - If they don't, it brings the user to another screen where they do a hearing test: they tap the screen every time they hear a noise.
- This screen should also ask them the questions: "Which sounds do you want to be louder?", followed by the following headers with yes / no buttons beside them
    - Vocal tones?
    - Background noise?
    - Emphasize softer or louder tones?

- This is the home screen of the app
- It only has a volume dial on it and a recalibration button
- This should be the default screen of the app after the first setup screen
- The recalibration screen should take you to the following manual calibration screen:

- This screen shows up if you change the automatic calibration / manual slider to be set to manual.
- I want to add this advanced drop down button with bass, mid, and treble dials and a wave form that changes according to the values of the dials
